AI GOVERNANCE OFFERING

Forefront AI Governance Readiness Assessment

Practical clarity for healthcare leaders adopting AI

Healthcare organizations do not need to build a full AI-governance program all at once. They do need a practical way to understand where AI is already operating, which uses matter most, what risks and accountability issues are emerging, and what actions should be prioritized first.

The Forefront AI Governance Readiness Assessment helps healthcare leaders establish that clarity through a structured, proportionate review of current AI use, governance maturity, risk exposure, controls, responsibilities, documentation, and assurance capability.

WHO IT IS FOR

- Hospitals and health systems
- Provider organizations operating multiple AI-enabled workflows
- Health-system leadership teams responsible for AI, quality, privacy, compliance, risk, or operational oversight

WHAT THE ORGANIZATION RECEIVES

Typical outputs may include:

- Current-state assessment
- AI-governance maturity profile
- Priority risk and control gaps
- Executive findings
- Recommended governance roadmap
- Near-term and long-term actions

WHEN THIS ASSESSMENT IS TIMELY

- AI tools are already in use but central visibility is incomplete.
- Leadership is unsure which AI uses create the greatest consequence or exposure.
- Governance responsibilities are fragmented across multiple functions.
- Vendor claims are difficult to evaluate independently.
- Validation, monitoring, or change-control expectations are unclear.
- The organization wants to move faster with AI but needs stronger evidence and decision structure first.

WHAT HAPPENS NEXT

The goal is not to produce a generic policy package. The goal is to help leadership determine the most practical next step for its current AI environment. Depending on the findings, next steps may include targeted governance design, use-case inventory and risk classification, vendor review, validation support, monitoring design, or broader executive advisory support.

WHAT FOREFRONT EXAMINES

Depending on the organization and use cases, the assessment may evaluate:

01 **Current AI inventory and known uses**

02 **Ownership and accountability**

03 **Governance structures and decision rights**

04 **Risk classification approach**

05 **Evidence and validation expectations**

06 **Human-oversight design**

07 **Vendor review and contractual protections**

08 **Monitoring, change, and incident processes**

09 **Documentation, traceability, and executive reporting capability**

CONSULTATION

To discuss whether a Forefront AI Governance Readiness Assessment is timely for your organization, request an AI Governance Priorities Consultation.
